

Problem Set 5

Bee Nguyen

March 2026

1 About the Data Set (no API key)

My website of choice to parse was Wikipedia and the topic of the table I created is about the tallest buildings in the OKC Metro Area. It is a smaller data table with about 10 observations. Some characteristics of each observation include the height, number of floors, and year it was built. I didn't use any online tutorials but I did reference our scraping notes from the lecture (mostly just did the same process in copying the selector). This data isn't particularly useful for me in terms of my research, but I would argue it is a pretty cool party trick!

2 Data Set (API Key Used)

I looked into seeing what data sets I could use for my research project and found IPUMS census data that would be pretty useful for my interests in college attainment and financial aid. There are a few variables that I included in the table, some include survey year, family income, age, sex, and education attainment. From IPUMS, I had nearly half a million observations across the US so I had to filter it down to just Oklahoma observations. Since my research question revolves around college attainment with and without OK Promise, I believe this data could be very useful into providing some insight to that. Problems will occur though, I have to find access to Oklahoma Promise's database of recipients and the Board of Regents.
