

## 1 Brief Summary

My interests in economics are mostly derived from my interest in how money flows between people in the economy. More specifically, I feel like by understanding the way money is produced and how it circulates between people in society, I can understand how to properly use my money or even provide guidance on policy implementation. Data science was something that came naturally along with my interests in economics. I participated with Price in their pursuit to define how economics was perceived on a corporate level and found that I don't think my personality aligns with the program offered there. Additionally, I love to challenge myself to learn new things and meet other students, so joining ECON 5253 was a perfect opportunity not only to learn something I perceive as difficult but also to meet people with similar interests.

Regarding some ideas I have for this class, I think I might do some research on education in Oklahoma. The main reason why I would want to do some research on education in Oklahoma would be to find ways to improve the very lagging school system and potentially suggest some methods to address the issues. Additionally, I want to discover more nuanced issues about systemic oppression of low class families and people of minority to highlight how education is influenced by numerous socioeconomic factors that the government can aid in.

My plans for graduation are still undecided. I want to get involved with the government and be a spokesperson for economic guidance (especially in a time period now), but I also recognize that being associated with the American government is not the best occupation as well, so I might seek other forms of employment in education or pursue higher learning.

## 2 Equation

$$a^2 + b^2 = c^2$$
