

Problem Set 6

Bee Nguyen

March 2026

1 Data Choice

I chose to utilize my existing Census API Key from Econometric Analysis to derive some national data regarding immigrants and their access to healthcare and how they compare financially to their native-born counterparts. Cleaning the data was not hard due to the nature of the Census API Key which requires me to select a table and select my variables of interest.

In my R script, I had Copilot and Claude aid me in creating my PNG's as well as identifying the specific tables I would use with tidycensus. Overall, everything was very familiar, especially since I used the same methods last semester to collect population data for Oklahoma over ten years.

2 Research Pivot

When I initially began gathering data on the efficiencies of higher education funding through Oklahoma's Promise, I found that gathering data on the specific individuals who received the grant was going to require me to have access to higher authorization. So, I pivoted to something just as important to me: Immigration enforcement and the impacts of excessive executive measures on the economic well being of immigrants and their children. I also am very familiar with ACS data and love to find more reasons to flounder around in its beautifully organized data frames.
